

# Powershell - Rename Folder

## Cmdlet

**Rename-Item** cmdlet is used to rename a folder by passing the path of the folder to be renamed and target name.

## Example 1

In this example, we'll rename a folder D:\Temp\Test to D:\Temp\Test1

Type the following command in PowerShell ISE Console

```
Rename-Item "D:\temp\Test Test1"
```

You can see the Test directory as Test1 directory now. There should not be another folder with same name already in the temp directory otherwise PowerShell command will fail.
